## RECOMMENDATION

**Subject Area:** RFI Testing

**Title:** Test Plans

### *Recommendation*

It is recommended that all RFI measurement projects be performed to a test plan. When tests are standard or routine, test plans may be general and adhere to generally accepted industry practice. The test plan should describe calibration techniques and show signal flow from test antenna to test receiver. Where non-standard tests are to be performed, especially where interference cases are to be cleared, the test plan should be submitted to the owner and/or the system frequency protector for review so that agreement can be reached on the measurement, analysis and reporting technique. Ample but reasonable time should be allowed for the review. Where possible, the owner and/or frequency protector should be allowed to participate in or witness the measurements.
